

Youth Health Mag: The partnership is strategic as each has something good to bring at the table. Dexcom has developed an FDA-approved technology called continuous glucose monitoring (CGM), which uses sensors to track glucose fluctuations underneath the skin all throughout the day. It is currently marketed as a complement to traditional monitors since it can provide more in-depth information. On the other hand, Google will provide the cloud-based system for the sensors. This means all readings by the device will be immediately uploaded into the cloud, which can then be accessed anytime and anywhere, as well as by concerned partners like physicians and patients.
