

"Mothers at risk of giving premature birth had low levels of lactobacillus bacteria, a microbe that is widely considered important for vaginal and intestinal health. Doctors have not shown a connection between premature births and the bacteria, but the study offers a new angle to approach the issue. Researchers speculate that a different type of bacteria may be taking the place of lactobacillus microbes. Scientists involved in the study are interested in carrying out larger trials with greater sample diversity in order to better determine the risks posed by low levels of this bacteria." And what are the data for women with ESRD? (no one knows)
